

# Imaging your particle beam in 3D: New approaches to beam alignment and beam profiling

Pedro Campuzano-Jost, Dongwook Kim, Hongyu Guo, Jose Luis Jimenez  
CU Boulder

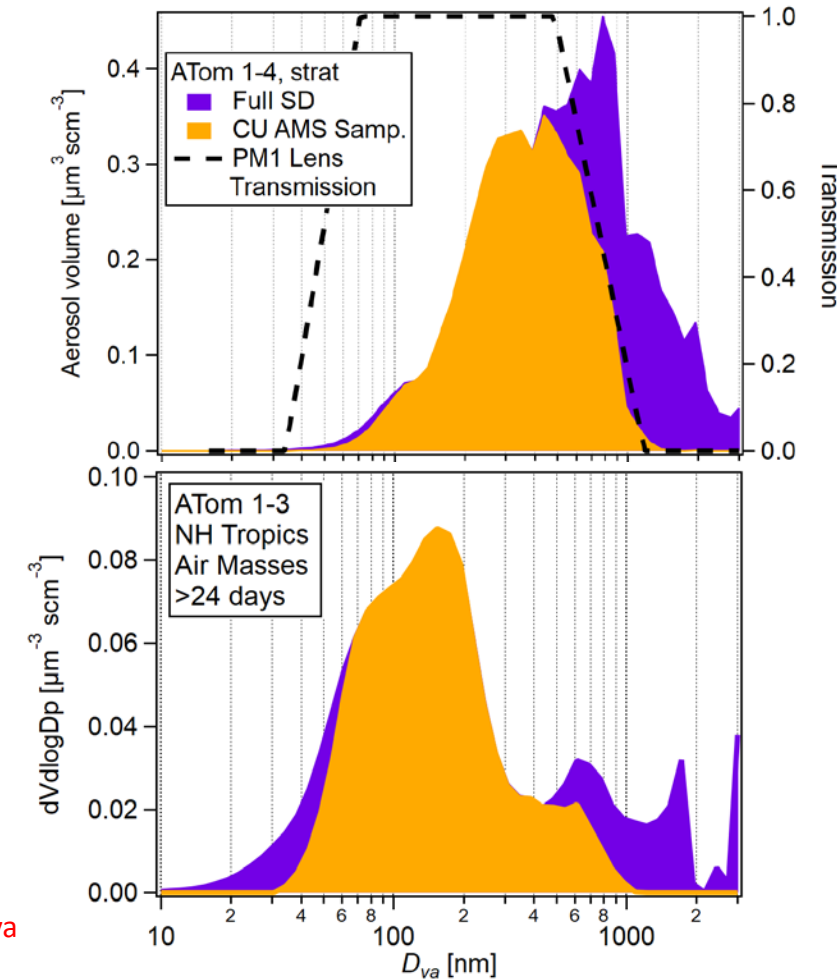

XXI AMS Users Meeting, First Virtual Meeting  
Jan 20<sup>th</sup>, 2021

# Motivation

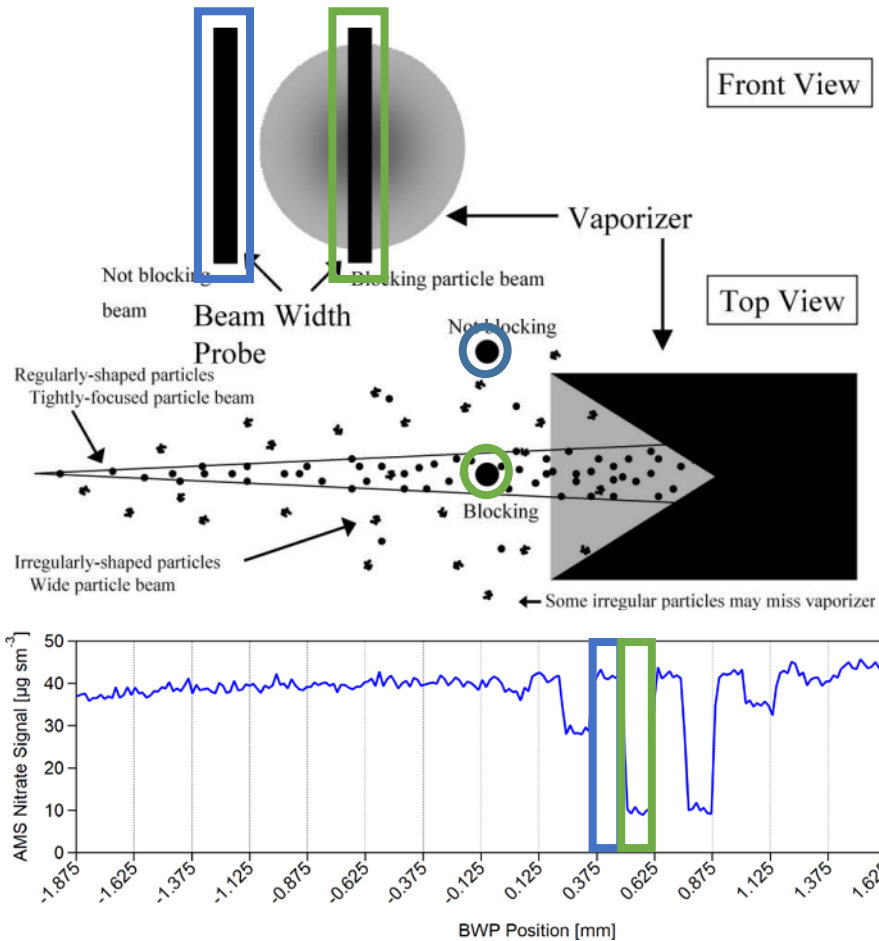

- Funded aircraft deployment into the tropical upper troposphere/lower stratosphere in 2022
  - Need new inlet that (Talk by Dongwook Kim, Jan 21<sup>st</sup>, 2020 13:00 EST):
    - Works at 75 mbar ambient pressure (currently 250 mbar)
    - Does ideally ~PM2 (currently PM0.75) for adequate sampling of sulfuric acid distribution
    - Does NOT lose sub-100 nm particles that are abundant in the UT (Williamson et al, 2019)
  - Size dependent transmission (ignoring particle bounce) depends:
    - On the “ideal” transmission thru the lens itself ( $E_L$ )
    - On the aircraft specific plumbing
    - On our ability to direct the lens output into the ionizer ( $E_s$ )
- Fast diagnostics that inform about beam shape and position as a function of  $D_{va}$
  - An improved alignment tool with diagnostic capability

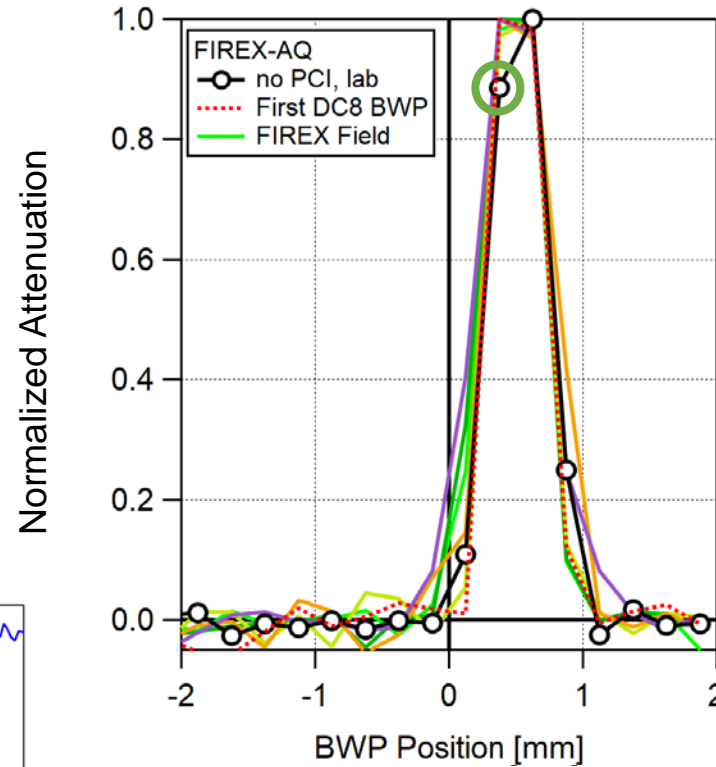

# Currently available tool: Beam Width Probe (BWP)

Huffman et al, 2005

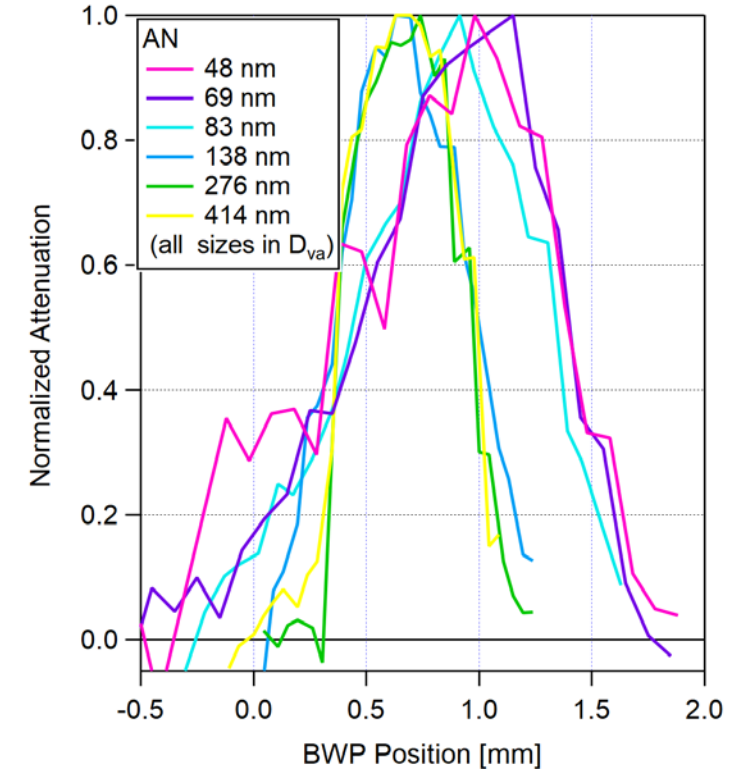

A BEAM WIDTH PROBE FOR THE AMS

500 nm AN, FIREX-AQ

Small Sizes, CU lab

- At large sizes (for PM1 lens) some resolution limitations (wire size is 0.5 mm)
- Very useful to confirm beam alignment and size dependent variability in focusing

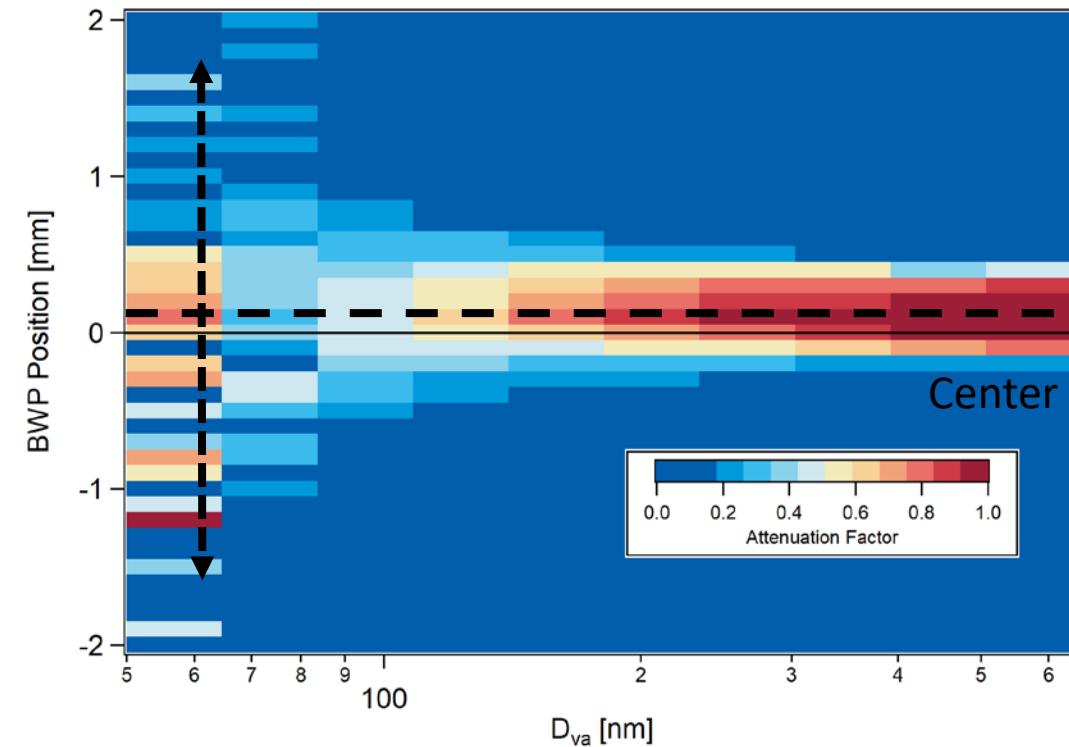

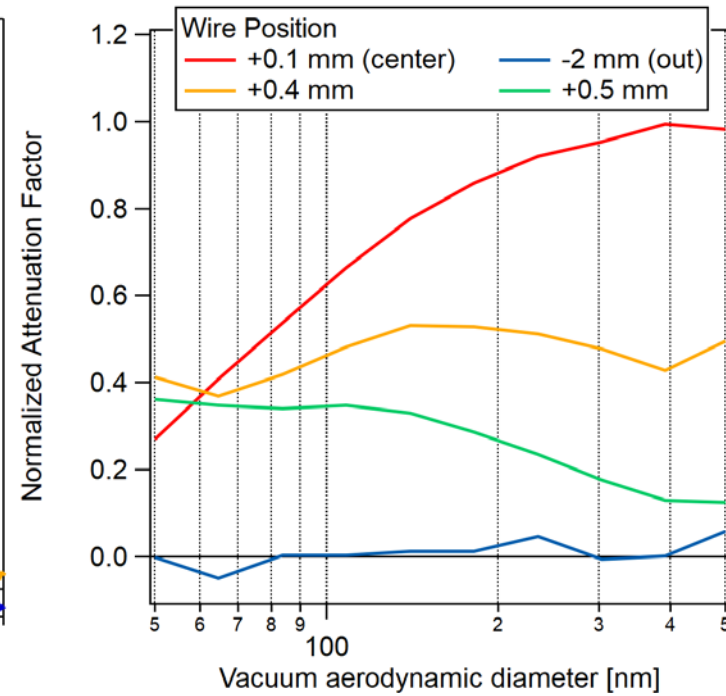

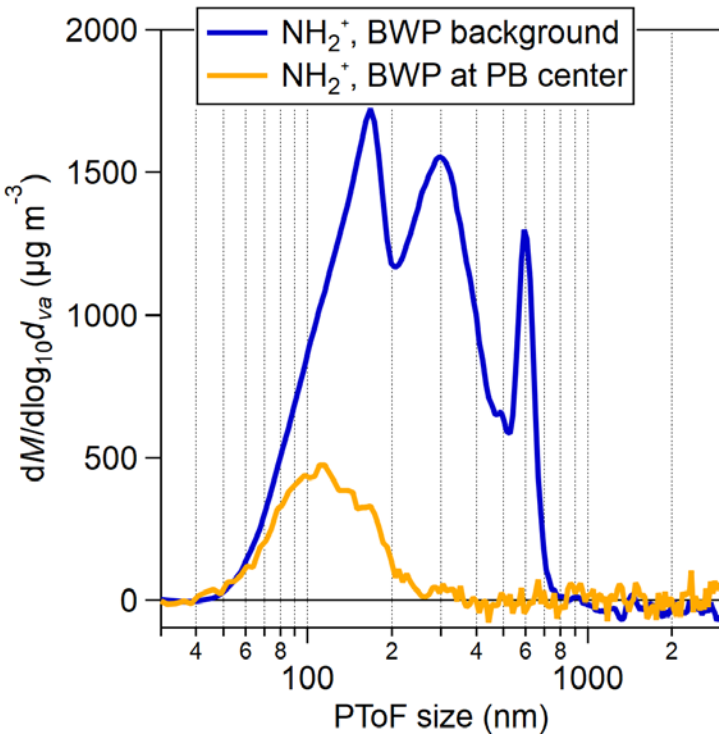

# Let's try to get that size info a lot faster: 2D (SD\*X) BWP

- Sample polydisperse calibration aerosol at high concentrations ( $>1 \text{ mg sm}^{-3}$ )
- Take one ePToF SD per BWP step (10 s), and set up the timing so wire movement is avoided

Compute:

$$Att\_ePToF(X, D_{va}) = \frac{SD(back) - SD(X)}{SD(back)}$$

Now take the whole scan of BWP positions and matrix transpose

# Rapid lens comparisons across sizes

PM1 Lens

PM2.5 Lens

REMINDER: Minimum Beam width/focus is limited by the BWP wire size

This PM2.5 lens (S/N 61) has a slightly tilted focus, in general focuses slightly worse

So can we measure such deflections in 2D? (e.g. 3D BWP  $SD^*(X,Y)$  attenuation)?

Aerodyne BWP

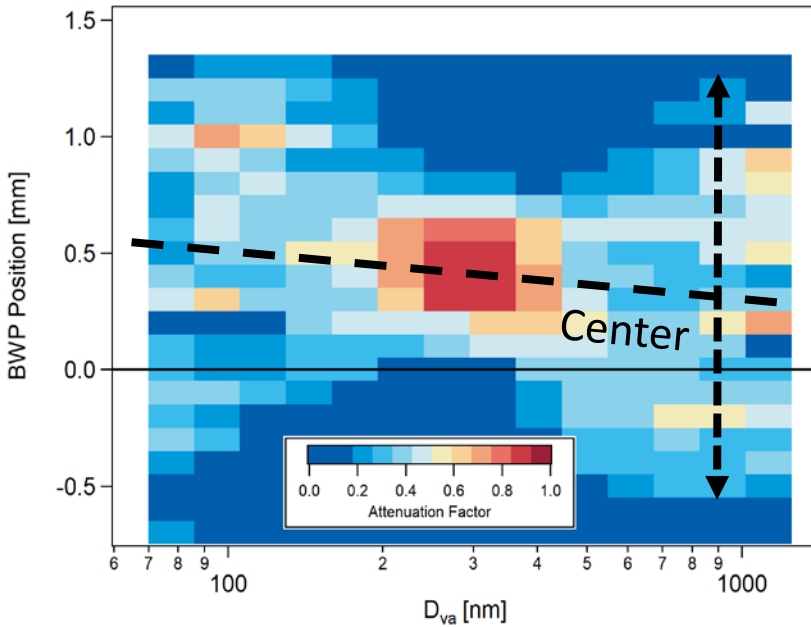

2D BWP

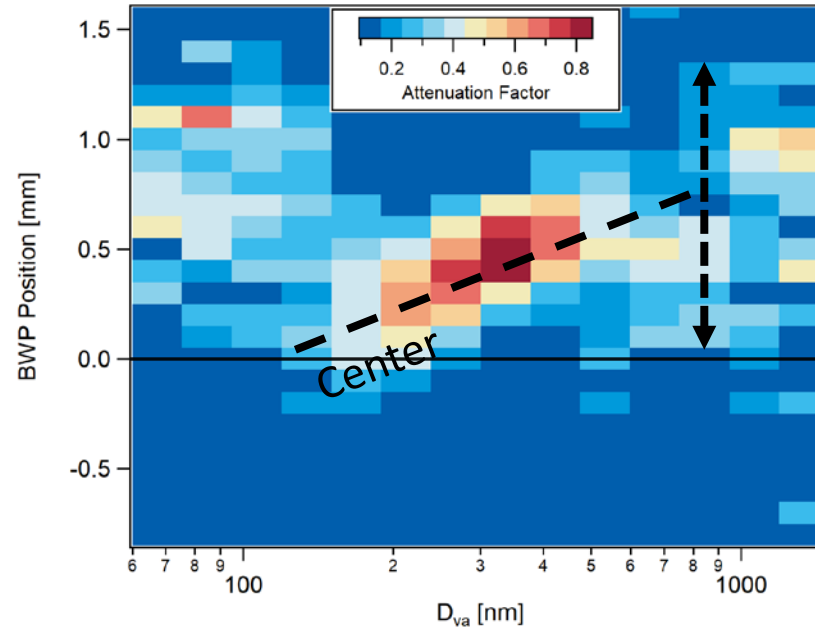

Luckily when John designed the BWP, he left 6 mm of unused space there..

# Preliminary Results (hot off the press): Elliptical beam

“vaporizer up/down”

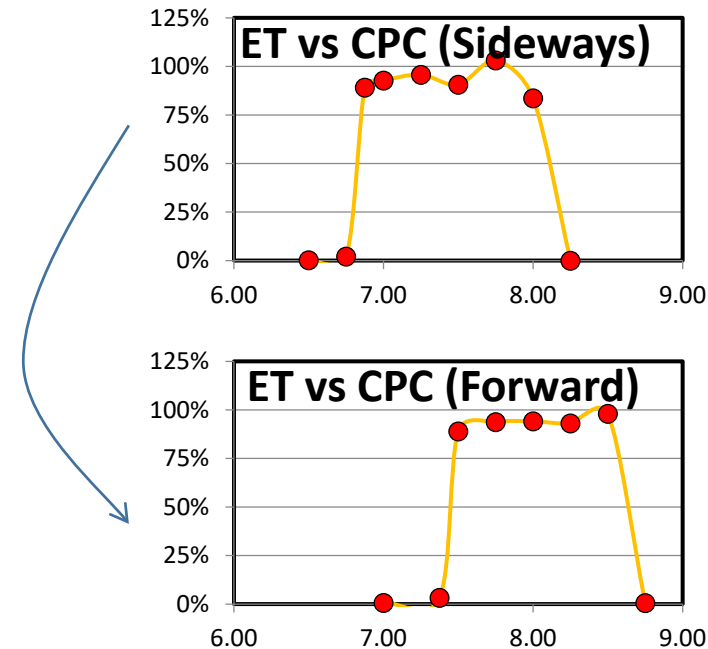

45 degree angle

“vaporizer left/right”

# Refresher: Aligning the aerosol lens in the AMS

Iterative process,  
until both beam  
widths  
are about the  
same

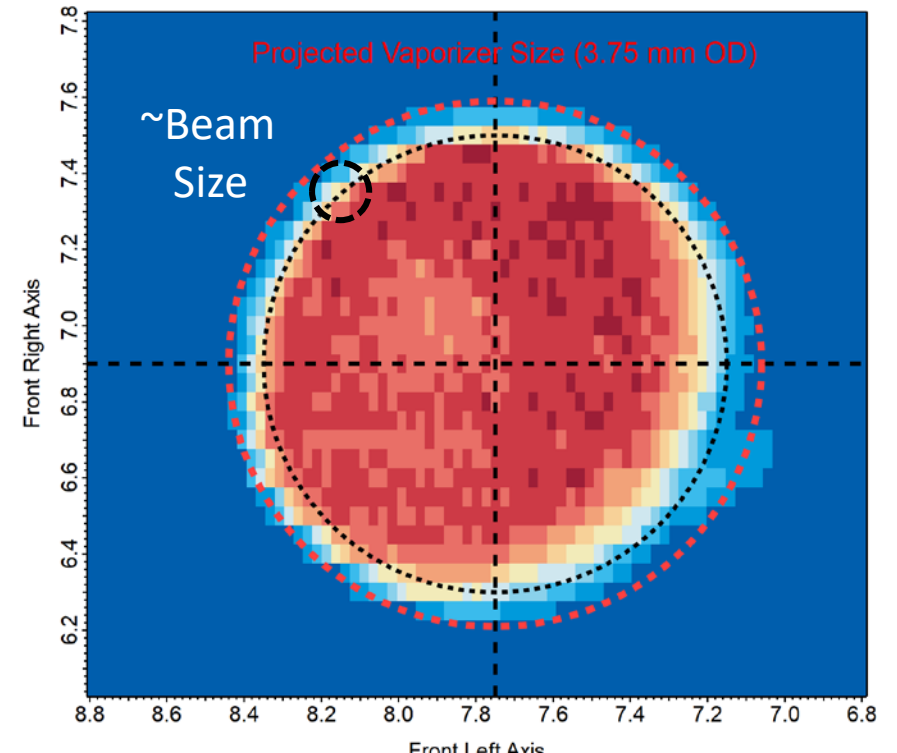

- Time consuming, prone to vacuum accidents
- Fairly low spatial resolution
- For aircraft instruments, particularly painful

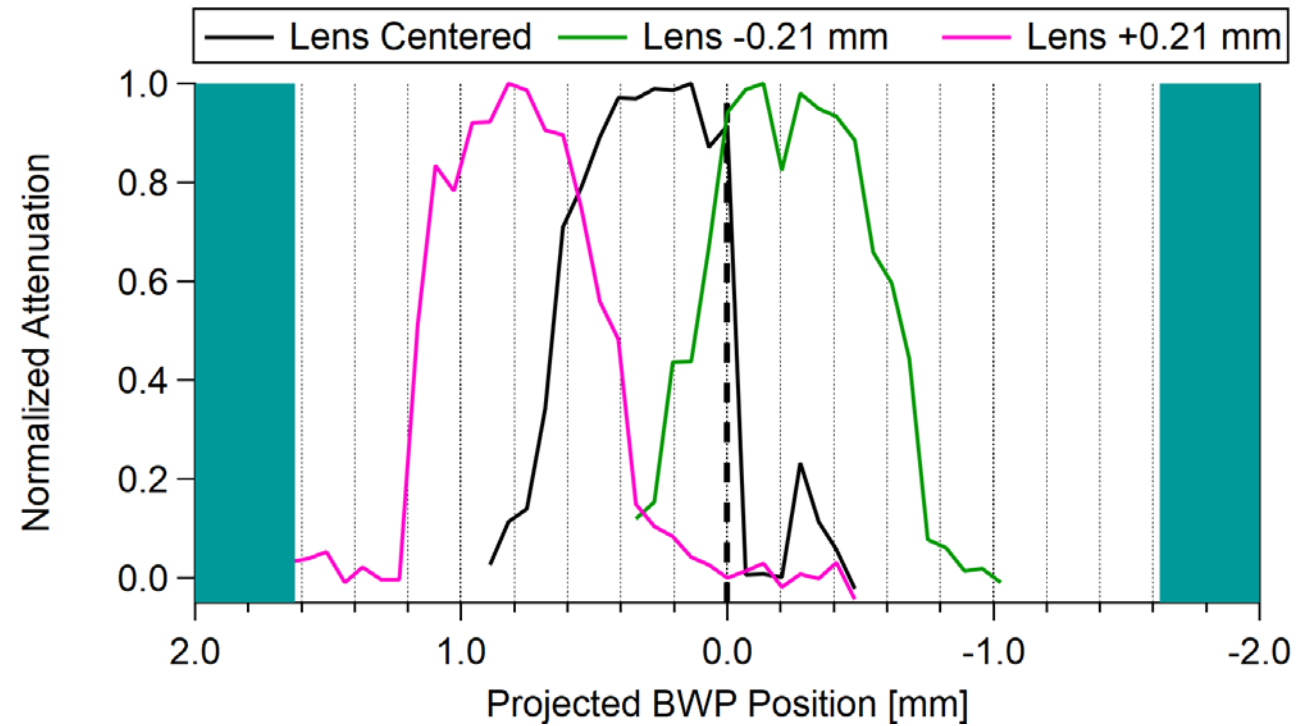

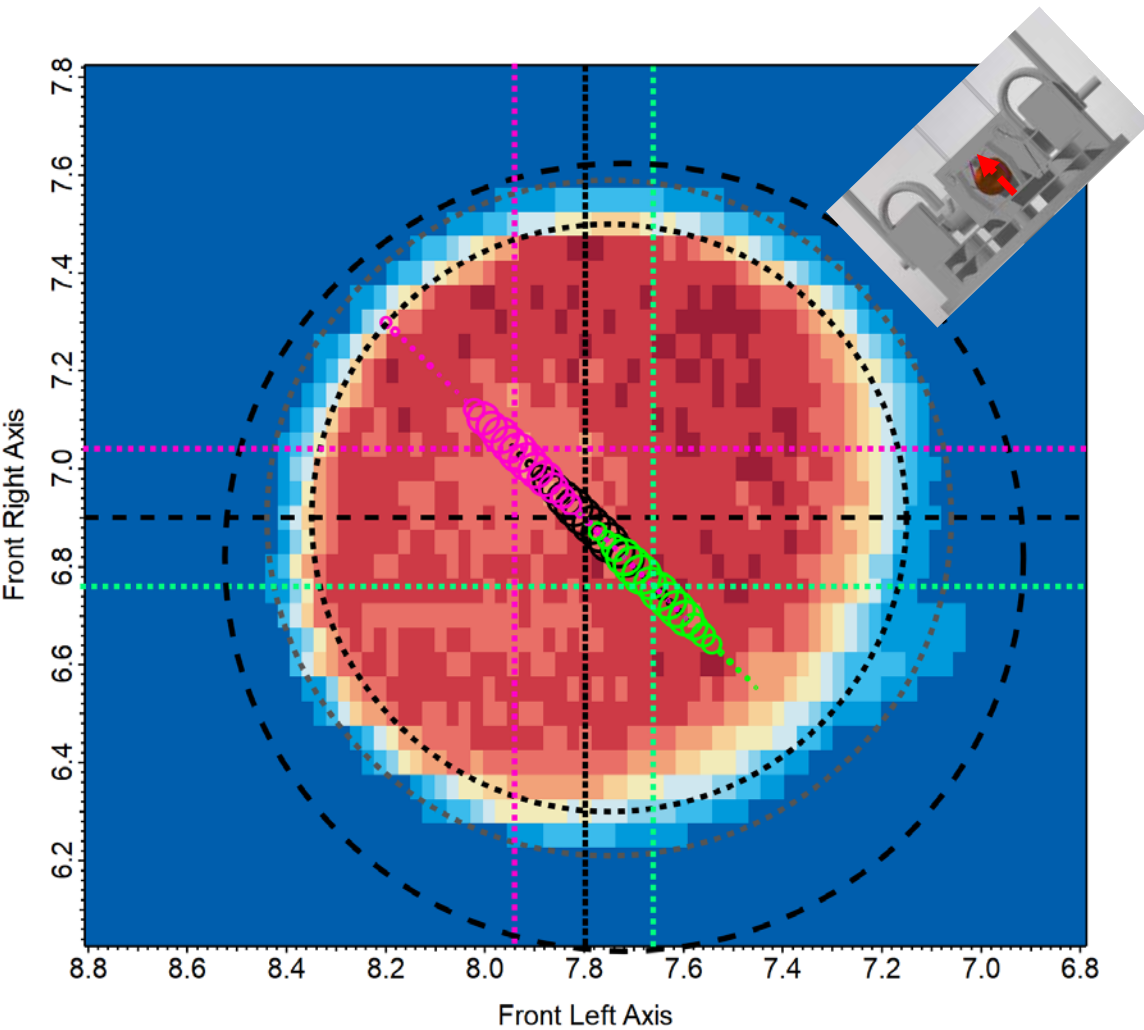

# A more user-friendly approach: automated lens stage better than 50 $\mu\text{m}$ resolution

Actual Geometry

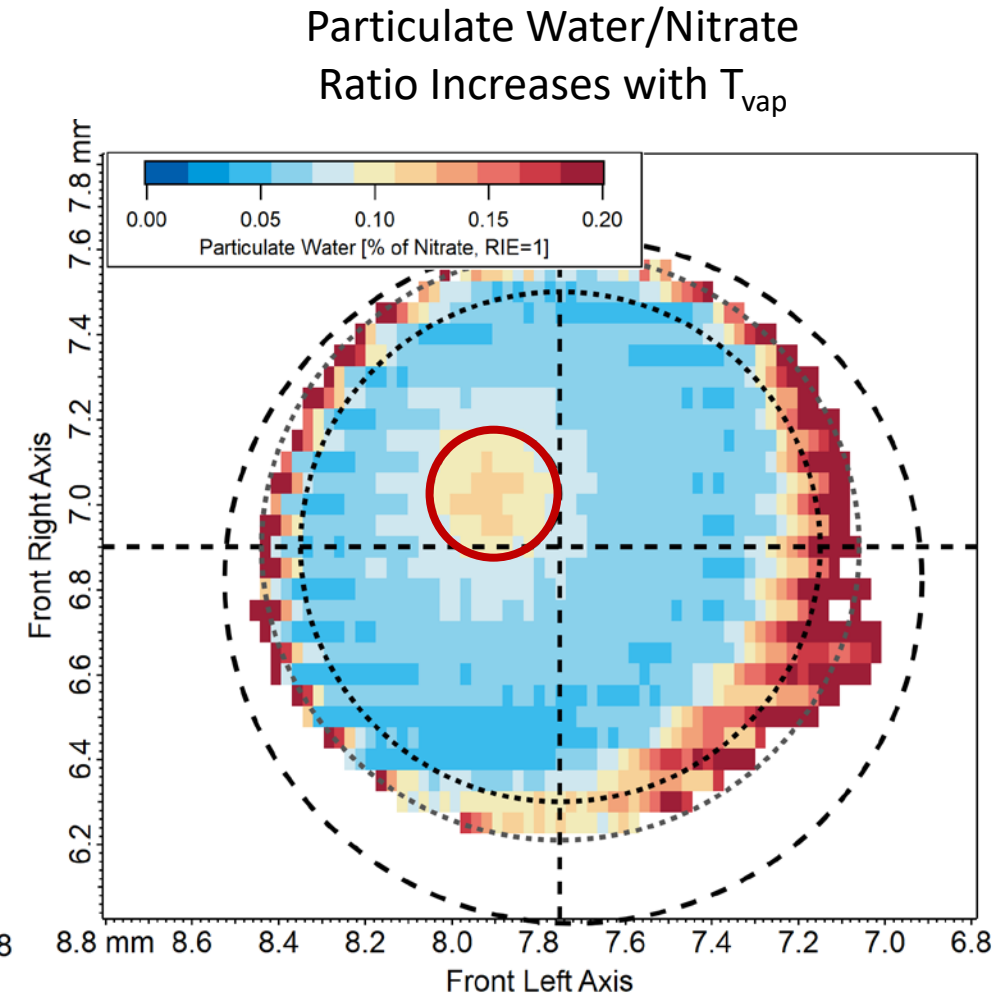

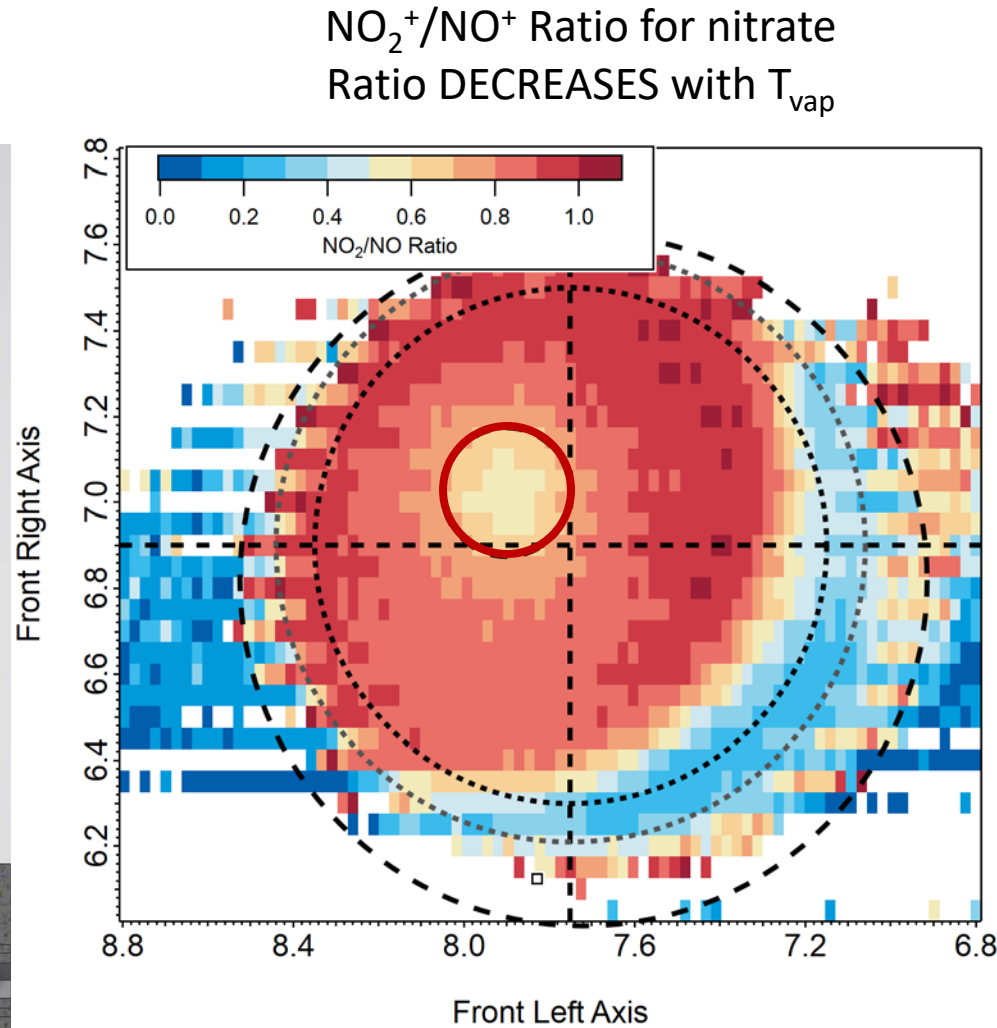

# Are we centered (I)? : Combining 1D-BWP and lens scans

So the vaporizer is sitting high. Can we get additional confirmation

# Are we centered (II)? Molecular thermometers!

Cross Section  
Standard Vaporizer

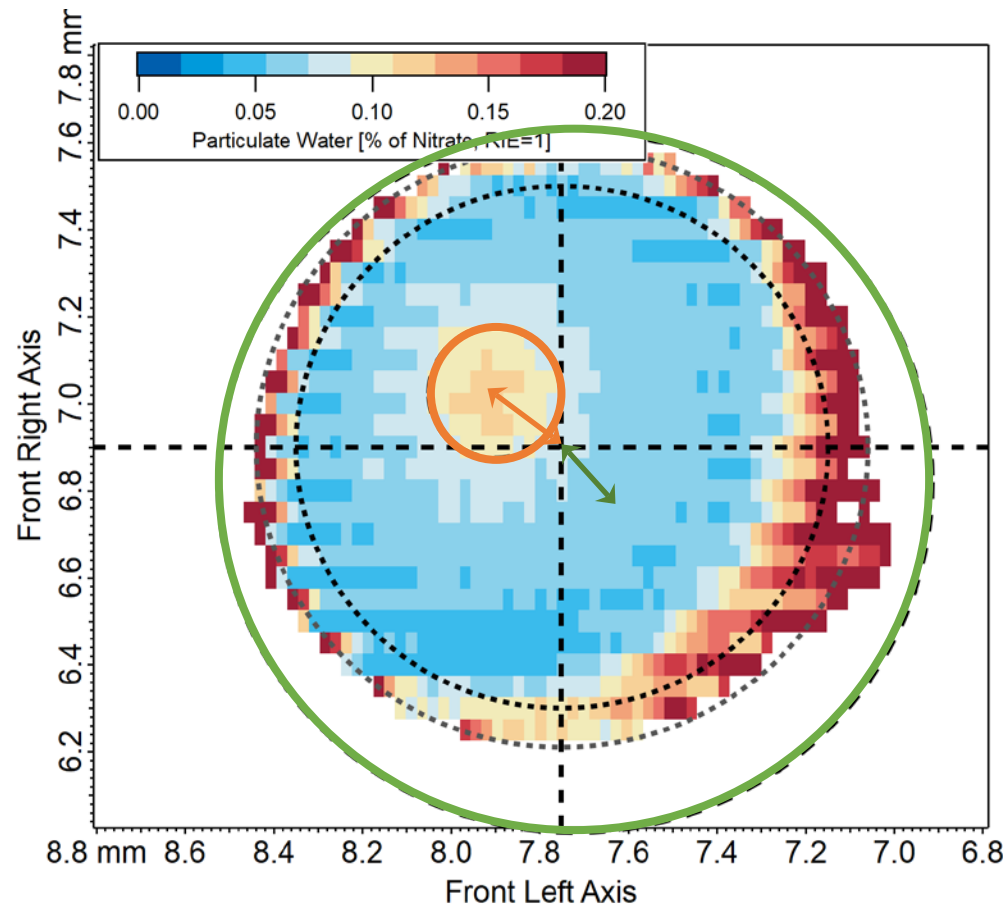

So this clearly confirms that the vaporizer is actually NOT aligned with instrument axis  
Can we quantify that?

# So how much off-center is this vaporizer?

Two independent measurements:

- Skimmer suggests vaporizer +0.12 mm (projected) in the vertical ( $\Rightarrow$  0.32 mm on the vap)
- Molecular thermometer suggest +0.18 mm, nearly vertical ( $\Rightarrow$  0.45 mm on the vap)

Taking the more robust measurement (+0.18 mm) results in a vertical angular deviation of the vaporizer of **+2.75 degrees**

This mostly within the installation tolerances!

# So should you worry about such misalignments?

Normally not, except if you care about:

Also if you modify the inlet flow field of your lens (e.g. for aircraft measurements)  
For some more examples, please attend Dongwook's talk tomorrow

# In Summary:

## 1. 2D Beam Width Probing

45 degree angle

## 2. 3D Beam Width Probing

“vaporizer left/right”

## 3. Automated Lens Alignment and vaporizer profiling

# One not-CE related application: Probing the Hu effect

Hu effect:

non-particulate  $\text{Cl}^+$  and  $\text{HCl}^+$  signals  
from the vaporizer when sampling  
nitrate

So can we see this happening on the vaporizer surface?

Chlorine Signal, pre-AChI calibration

Chlorine signal, after "etching" the vaporizer

Perform AChI "RIE Calibration" with  
the lens position as shown
