Balloon Winds

Instrument Overview

Size: 8'x8'x12'

Gondola Mass: 6000 lbs

Power Requirements: 1300 W

Power System:

26 Lithium-Ion Batteries

Thermal Management:

Ice and Electric Heaters

Optical Systems:

Diode-Pumped Nd:YAG

1/2-meter Telescope

Direct-Detection Receivers (2)

Material:	Cast Aluminum MIC6	Wrought Aluminum 6061-T6
Ultimate Strength:	166 MPa	310 MPa
Yield Strength:	105 MPa	275 MPa
Elongation at Break:	3%	12%
Lid thickness (M/R)	0.5" (0.065")	2.25" (0.25")
Lid/base attachment	Inserted threads	Through bolts
Weight	~200 lbs	~400 lbs

Laser Chamber Design

Geometry

- Lid:
 - 2.25" thick with weight relief and top plate
 - 3/8" through bolts aligned with ribs
- Base Plate:
 - 2.25" thick with weight relief
 - 3/8" through bolts for base plate
- Walls:
 - 1.5" thick with weight relief
 - Bolted at corners before welding

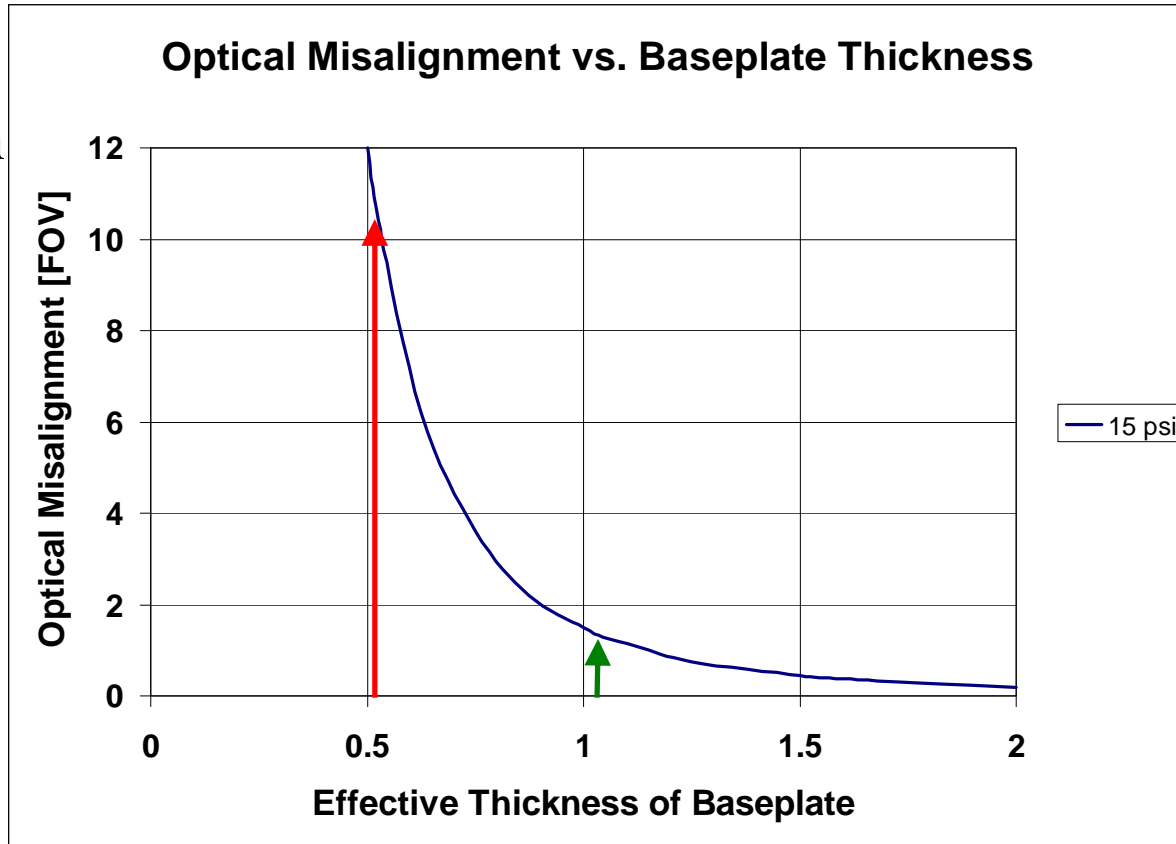

Laser Chamber Base Plate

- Base Plate Comparison

Old/New

- Double effective thickness
- 85% reduction in optical misalignment

Laser Chamber Build post-welding

Raytheon

Michigan Aerospace

Proprietary

Laser Chamber Testing

- Passed hydrostatic pressure test @ 28 psig
 - Passed pneumatic pressure test @ 22.5 psig
-
- Final assemble pressure test @ 22.5 psig remains

Chamber Reviews

Coolant Tank

Material

304L Stainless Steel

Volume (empty)

18 cubic feet

Design Pressure

18.75 psig

☒ Test Pressure (Hydrostatic)

28 psig

Assembly Test Pressure (Pneumatic)

22.5 psig (1.5× MEOP)

Electronics Chamber

Material

304L Stainless Steel

Volume (empty)

30 cubic feet

Design Pressure

18.75 psig

☒ Test Pressure (Hydrostatic)

28 psig

☒ Assembly Test Pressure (Pneumatic)

22.5 psig (1.5× MEOP)

Interferometer Chamber

Material

304L Stainless Steel

Volume

14 cubic feet

Design Pressure

16.5 psig

☒ Assembly Test Pressure (Pneumatic)

22.5 psig (1.5× MEOP)

Revised BalloonWinds Schedule

Activity	Date
Laser Chamber CDR	01 Aug 07
Re-Integration	28 Feb 08
Leave UNH	7 Apr 08
Thermo-Vacuum Test	20 Apr 08
First Launch	21 May 08
Second Launch	11 Jun 08
Return to UNH	16 Jun 08
